Winds

Exercise 1

long	length
broad	breadth
strong	strength
deep	depth
high	height
wide	width

Winds

Exercise 2

1. If it <**rains**>, we <**will not load**> that lot of cement.
2. When the gale <**blows**>, the port <**will stop**> working.
3. If the weather <**is**> good, the workers <**will finish**> loading cargo this afternoon.
4. If I <**were**> you, I <**would put**> double lashing on the cargo because they forecast a storm.
5. If you <**had listened**> to the weather forecast yesterday, you <**would have known**> about the gale warning.
6. If the hurricane Katrina <**had changed**> its course, New Orleans would have been saved.
7. If the people <**had been warned**> in time about the hurricane, more lives <**would have been saved**>.
8. If the hurricane Wilma <**had gone**> east, it <**would have devastated**> the coast of Cuba.
9. If there <**is**> a seaquake, it may cause a tsunami.
10. If the cargoes <**were loaded**> on deck now, they <**would have to be lashed**>.

Winds

Exercise 3

Slowly	moving at less than 15 knots
Steadily	moving at 15 to 25 knots
Rather quickly	moving at 25 to 35 knots
Rapidly	moving at 35 to 45 knots
Very rapidly	moving at more than 45 knots

Winds

Exercise 4

Becoming cyclonic	indicates that there will be considerable changes in wind direction across the path of a depression within the forecast area.
Veering	indicates the changing of the wind in a clockwise direction, that is from south-west to west.
Variable	indicates the wind constantly changing the direction from which it blows.
Backing	indicates the changing of wind in the anticlockwise direction, that is from west to south-west.
Wind direction	indicates the direction from which the wind is blowing.

Waves

Exercise 1

Waves are primarily caused by the wind and its action on the <surface> of the water. Their <height> depends on how long the wind has been blowing and also on the <strength> of the wind. Waves formed by the wind blowing locally are termed <sea>. Waves formed by the wind blowing at a <distance> from the place of observation are termed <swell>.

Some waves result from <earthquakes> or underwater <seaquakes> and on approaching <shallow> water they become abnormally high and begin to break with great violence causing enormous <devastation> and loss of life. They are termed “tsunami” and we will all remember the tragic seaquake near Sumatra on Dec. 26th, 2004, which claimed the lives of nearly 300,000 people in South-East Asia.

Visibility

Exercise 1

Visibility at sea may be affected by various weather conditions in different parts of the world. In the north it may be affected by rain, <sleet>, snow, <hail> and <blizzards> or snow storms. In the south it may be affected by <torrential> rains, <drizzle> or showers as well as by sand storms. <Mist>, <haze> and fog may appear in all areas of the world at different times of the year.

The passage of very cold air over much warmer water causes arctic sea smoke, frost smoke or steam fog. It is formed when the lowest layers of the cold air heated by contact with the warm sea tend to rise and are <chilled> to their <dew point> on meeting colder air than themselves.

Visibility

Exercise 2

1. Many fishing vessels <were damaged> in Indonesia when the tsunami wave hit the islands.
2. The coastal regions of Thailand <have been devastated> by a giant wave recently.
3. Many people <have been forced> to leave their homes in Sri Lanka because of flooding.
4. Ships are again <being attacked> by pirates near the Malacca Straits.
5. The collision in dense fog could <have been avoided> if they had used radar.
6. Visibility <is restricted> by heavy snowfalls.

Clouds and weather symbols

Exercise 1

heavy	light
high	low
horizontal	vertical
hard	soft
dry	wet
strong	weak

Clouds and weather symbols

Exercise 2

Clouds consist of <minute> drops of water or ice crystals formed by the <condensation> of water <vapour> and held in suspension in the atmosphere. There are two main types of clouds: <stratiform> or layer cloud, resembling fog but not resting on the ground, and <cumuliform> or white cotton-wool cloud with much greater <vertical> development than <horizontal> extent. There are also combinations of these clouds depending on the height of occurrence and then we speak about cirrus clouds and cirro-cumulus, and cirro-stratus, which are <high> clouds; alto-cumulus, alto-stratus and nimbo-stratus, which are <medium> height clouds and strato-cumulus, stratus, cumulus and cumulo-nimbus, which are <low> clouds.

Navtex

Exercise 1

HIGH SEAS FORECAST

<NATIONAL> WEATHER SERVICE WASHINGTON DC/TPC MIAMI FLORIDA

MARINE <PREDICTION> CENTRE/MFB 1700 UTC JAN 2002

<SUPERSEDED> BY NEXT ISSUANCE IN 6 HOURS

<SECURITE>

PACIFIC NORTH OF 30N AND EAST OF A LINE FROM <BEARING> STRAIT TO 50N 160E

<SYNOPSIS> VALID 1200 UTC Jan 7. FORECAST VALID 0000 UTC Jan 9.

WARNINGS.

STORM 45N 175W 953MB WILL MOVE NE 25 KT. WINDS 45 TO 60 KT SEAS 25 TO 40 FT ELSEWHERE WITHIN 660NM S AND 240NM N SEMICIRCLES.

Weather

Revision task 1

Torrential	rain
Gale-force	winds
Light	breeze
Dense	fog
Widespread	flooding
Heavy	snowfall
Tropical	storm
Poor	visibility

Revision task 2

drizzle	•
fog	≡
lightning	⚡
mist	==
passing showers	• ▽]
squalls	▽
rain	•
snow	*
thunderstorm	⚡
haze	∞

Weather

Revision task 3

Rough	Calm
Thick	Thin
Visible	Invisible
Frequent	Infrequent
Clear	Unclear
Usual	Unusual
Safe	Unsafe
Rapid	Slow
Ugly	Beautiful
Overcast	Sunny

Weather

Revision task 4

atmosphere	atmospheric
barometer	barometric
difference	different
distance	distant
horizon	horizontal
torrent	torrential
violence	violent
environment	environmental

Weather

Revision task 5

Adjective	Opposite adjective	Noun	Adverb	Opposite adverb
normal	abnormal	normality	normally	abnormally
clear	unclear	clarity	clearly	unclearly
frequent	infrequent	frequency	frequently	infrequently
legal	illegal	legality	legally	illegally
legible	illegible	legibility	legibly	illegibly
possible	impossible	possibility	possibly	impossibly
probable	improbable	probability	probably	improbably
regular	irregular	regularity	regularly	irregularly

Weather

Revision task 6

What is the wind **<direction>** and **<force>** in your position?

What wind is **<expected>** in my position?

What is the latest **<gale>** warning?

What is the latest **<tropical>** storm warning?

What is the **<atmospheric>** pressure in your position?

What is the **<barometric>** change in my position?

The barometer is **<steady>**

What is the **<sea state>** in your position?

Is the sea state expected to change **<within>** the next 2 hours?

An **<abnormal>** wave is expected by 2100 UTC.

What is the **<visibility>** in your position?

Visibility is **<restricted by fog>**.

What is the **<latest>** ice information?

Ice situation is not expected to **<deteriorate>** in your position.

<Thickness> of ice is expected to increase in your position.

Navigation is dangerous in area around Gdansk due to **<floating ice>**.

Navigation in area around Kotka is only possible for **<high-powered>** vessels of construction.
